The study of genetic variations in Homo sapiens shows that there is more genetic variation within populations than between populations. This means that two random individuals from any one group are almost as different as any two random individuals from the entire world.

Activity 1: Genetic Variation in Populations

Genetic variation is a measure of the genetic differences that exist within a population.

The genetic variation of an entire species is often called genetic diversity. Genetic variations are the differences in DNA segments or genes between individuals and each variation of a gene is called an

Genes are inherited segments of DNA that contain codes for the production of proteins.

Genes exist in alternate versions, or alleles that determine distinct traits that can be passed on from parents to offspring.

Genetic variation is the diversity present in the DNA of a population. Increased variation provides phenotypic changes that can be selected for or against by natural selection. Increased genetic variation also provides an advantage in adapting to changing environments.
