Sensorless Field Oriented Control with Embedded Power SoC Z8F68474109 Scope and purpose of this document Figure 1 This document is meant to give the reader a basic introduction to field oriented control and how it can be implemented on the Infineon embedded Power SoC devices for low-to-mid power 3-phase motors in automotive applications.

Sensorless Field Oriented Control with Embedded Power SoC

Field oriented control improves dynamic response by adjusting both amplitude and phase of the control signals fed back to the motor. Applications such direct drive washing machines benefit with this advantage. In Field oriented control, stator field is continuously updated based on the position of the rotor field.

Field-Oriented Control (FOC) is a control method in which electrical quantities of a three-phase PMSM are modeled and controlled as vectors. These vectors can be split into two orthogonal components: one along the rotor magnetic flux ('direct axis' denoted by 'd') and the other orthogonal ('quadrature axis' denoted by 'q') to it.

Vector control, also called field-oriented control (FOC), is a variable-frequency drive (VFD) control method in which the stator currents of a three-phase AC electric motor are identified as two orthogonal components that can be visualized with a vector. One component defines the magnetic flux of the motor, the other the torque. The control system of the drive calculates the corresponding ...

The sensorless drive predates the field-oriented control drive and cannot provide such precise control. As the name suggests, it does not require a position sensor but instead makes “guesses” based on current feedback and what it knows about the motor. This system is adequate for many applications.
